

Towards the Measurement of a 3D Dynamic Urban Environment using an Intelligent Vehicle

Huijing Zhao, zhaohj@cis.pku.edu.cn

Key Lab of Machine Perception (MOE)

Peking University

Our final goal

is to enhance driver safety, traffic data collection and generating a digital copy of a dynamic urban environment.

We want to **detect** the **moving objects** in the surroundings, and **track** their **states**, such as speed, direction, and size, so that dangerous situations can be predicted.

We also want to **generate a 3D copy** of the dynamic urban scenery that contains both stationary objects, e.g. buildings, trees, road etc., and mobile objects, e.g. people, bicycles and cars.

We also want to **locate** our-self into the virtual space.

■ Objective

- Sensing a large dynamic environment in order for driving safety, 3D mapping and traffic data collection.

■ Three Problems

- Localization
- Mapping
- Mobile objects' detection, tracking and classification

■ Our Solution : An Intelligent Vehicle

- localization errors in urban area
- a mixture of data from both mobile and static objects

GPS

IMU

L1

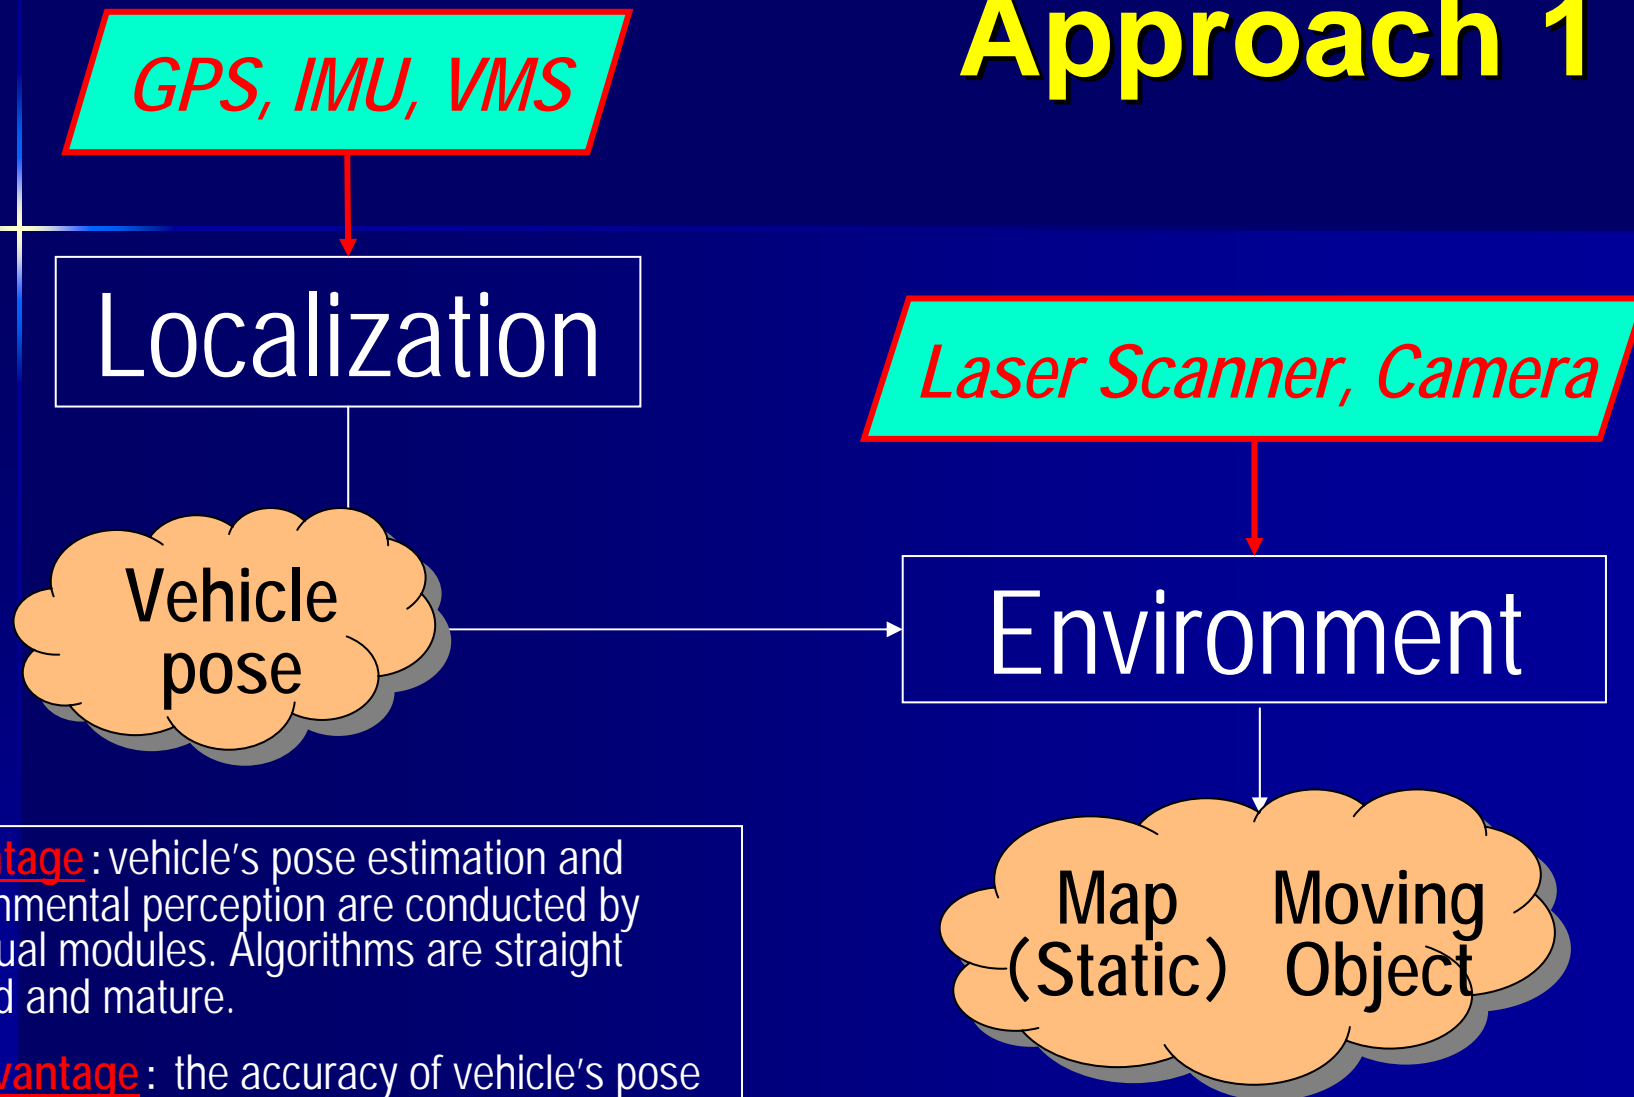

L5

Video Camera

Laser Scanner
L2,L3,L4

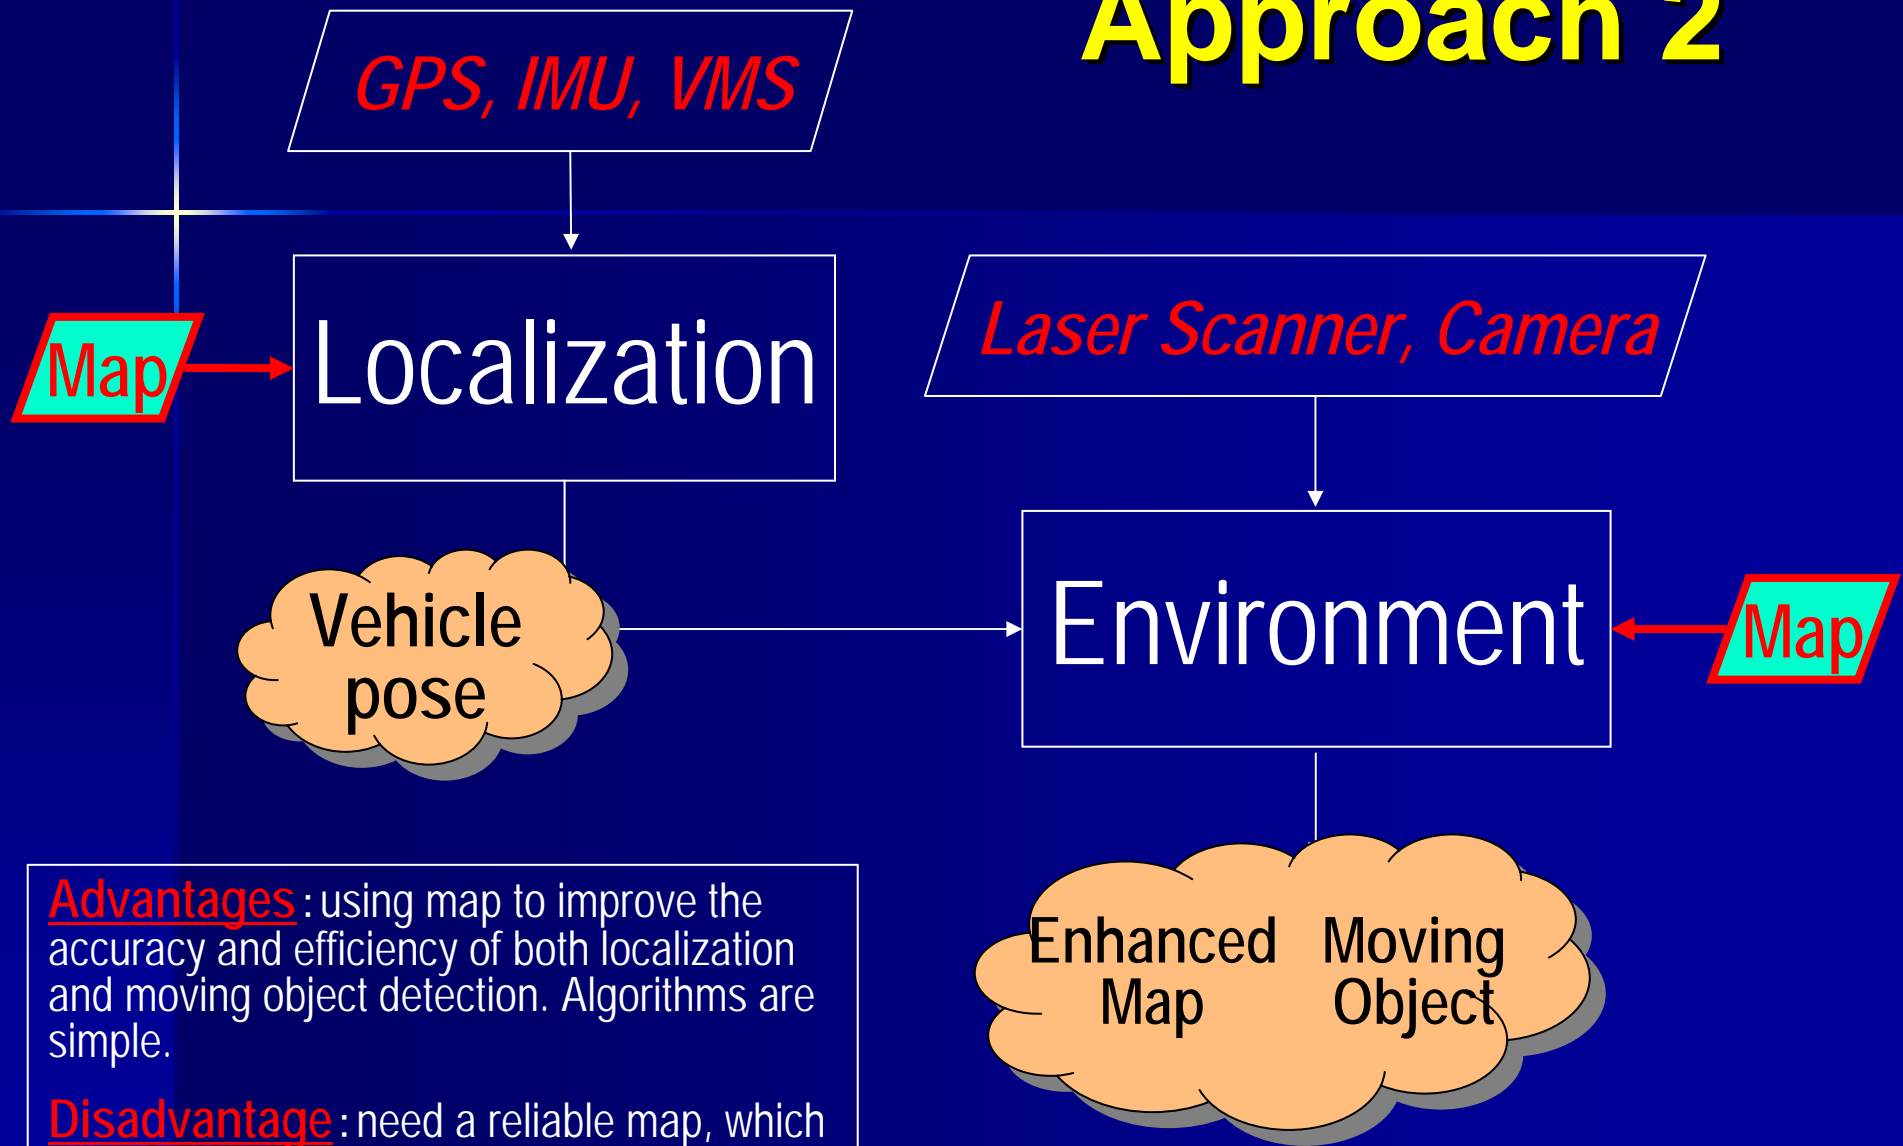

Approach 1

Advantage: vehicle's pose estimation and environmental perception are conducted by individual modules. Algorithms are straight forward and mature.

Disadvantage: the accuracy of vehicle's pose estimation is heavily dependant on positioning sensors. Difficult to detect slow motion objects, such as people, due to pose error.

Approach 2

Advantages: using map to improve the accuracy and efficiency of both localization and moving object detection. Algorithms are simple.

Disadvantage: need a reliable map, which is a strong limit to applications.

Our Try !

GPS, IMU, VMS

SLAM
in Dynamic Environment

Laser Scanner, Camera

Vehicle
Pose

2D Map
(static)

2D Mobile
Object

Environment

3D Map
(Static & Mobile)

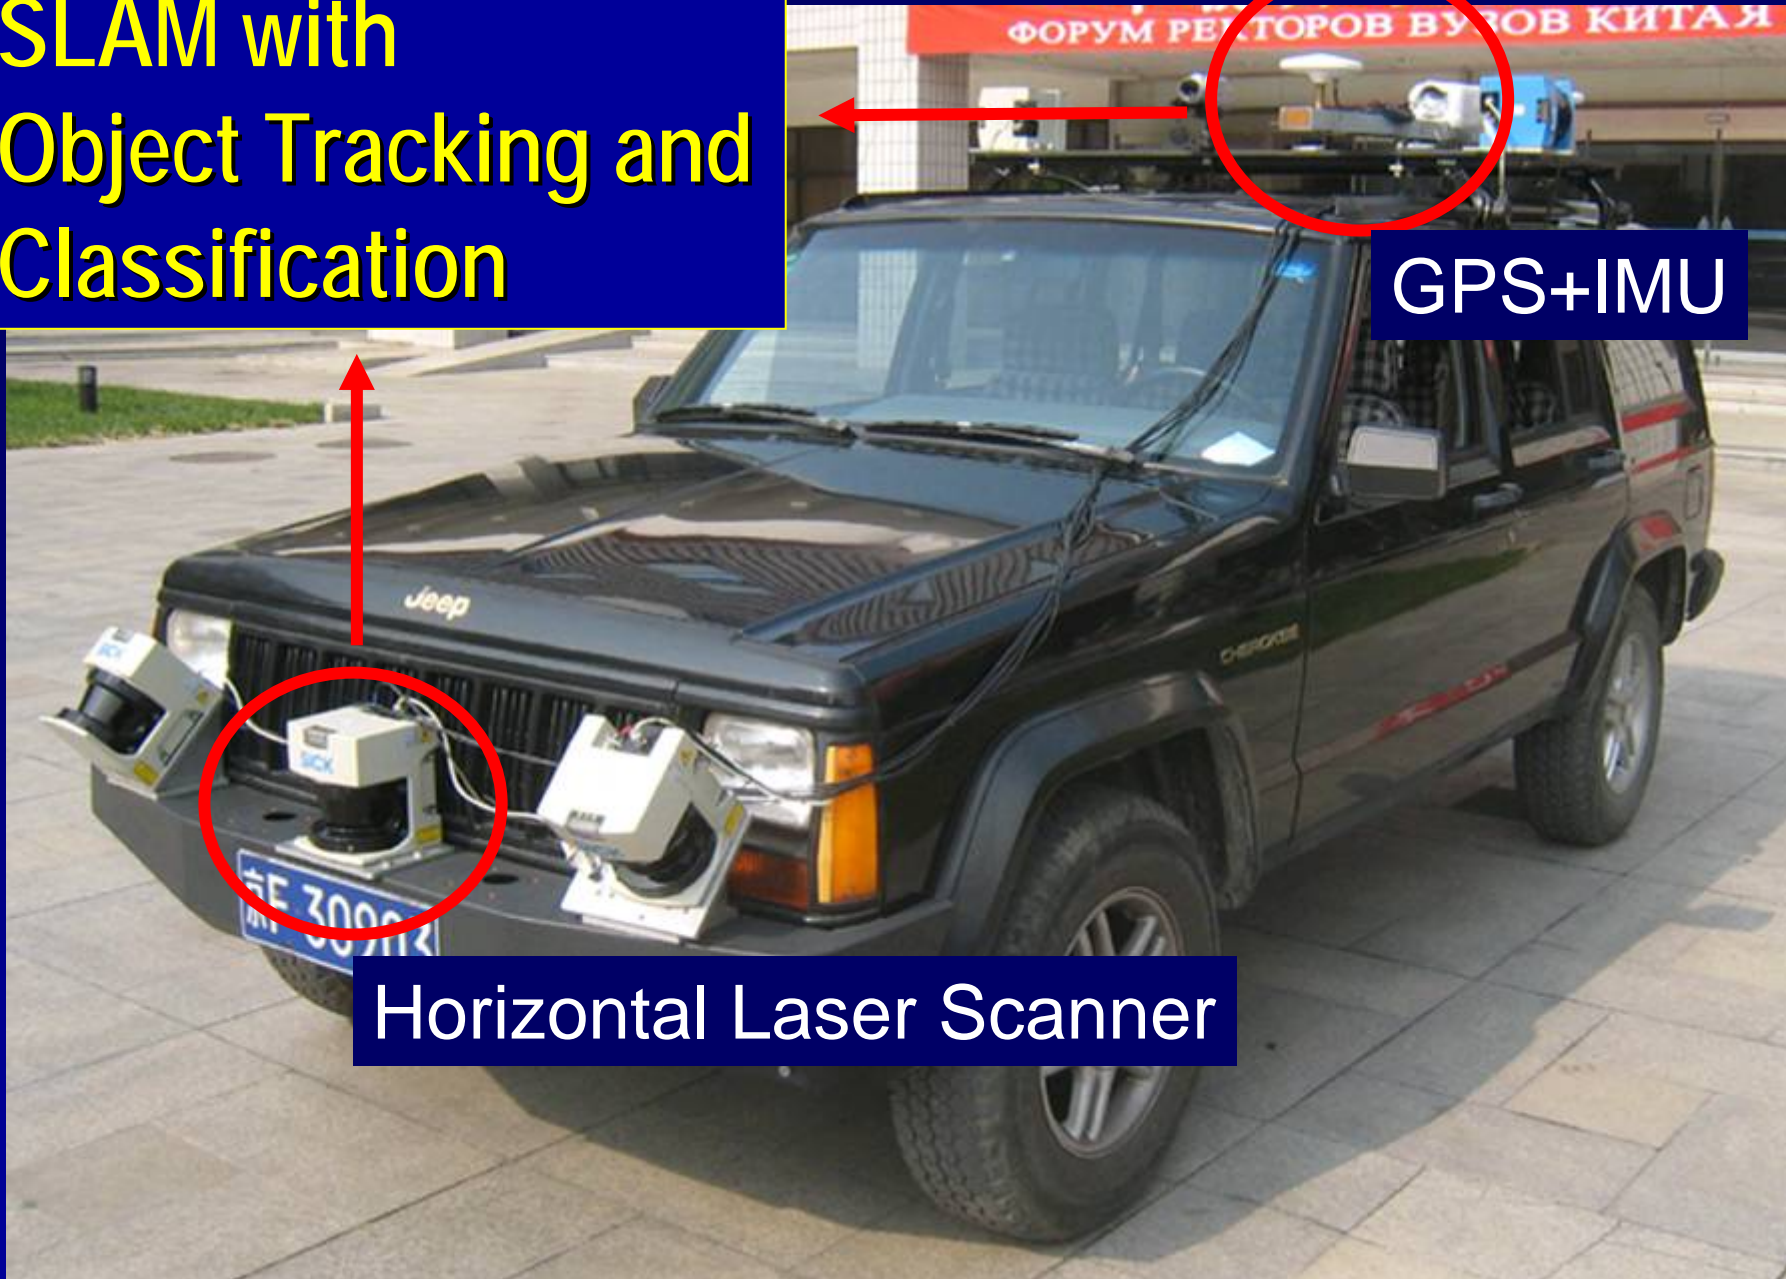

Advantage: vehicle pose estimation, mapping, moving object detection and tracking are treated as a simultaneous optimization problem.

Many possibilities !

Disadvantage: rely on software processing. Algorithm is complicated. Computation cost is high.

We try to make a framework !

SLAM with Object Tracking and Classification

GPS+IMU

Horizontal Laser Scanner

Classification Results

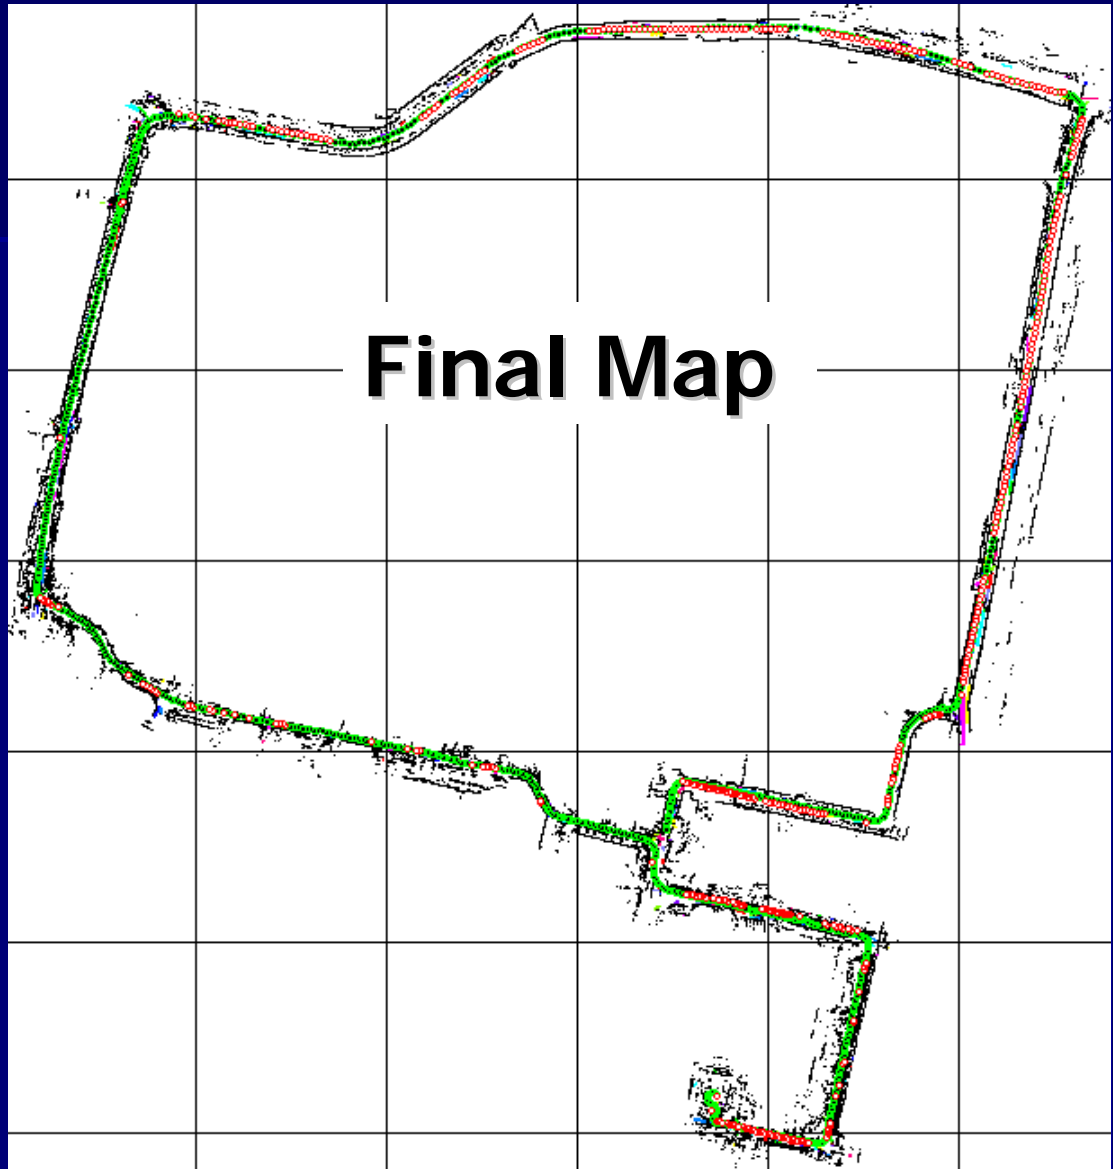

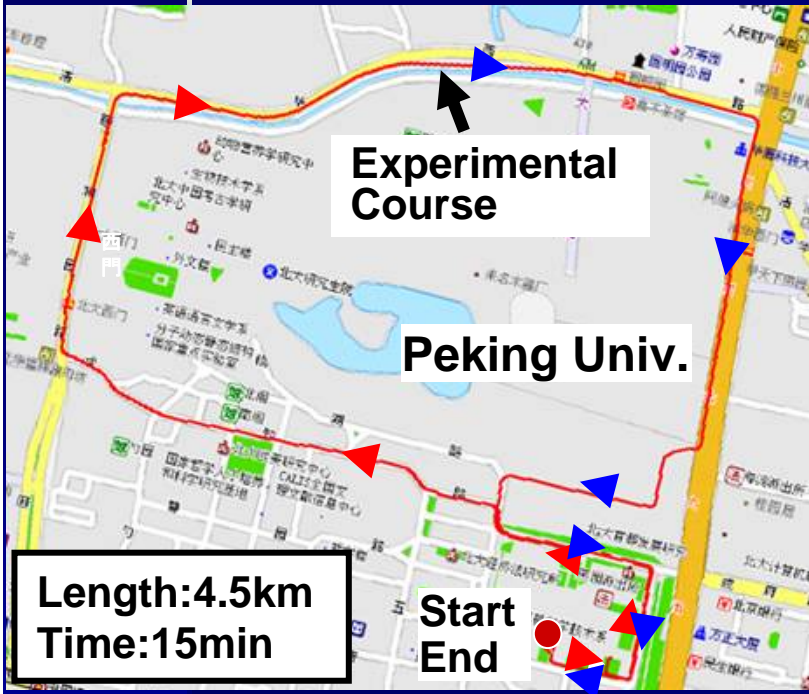

Objects

-  people
-  bicycle
-  group
-  car

Laser Points

-  moving
-  seed
-  group

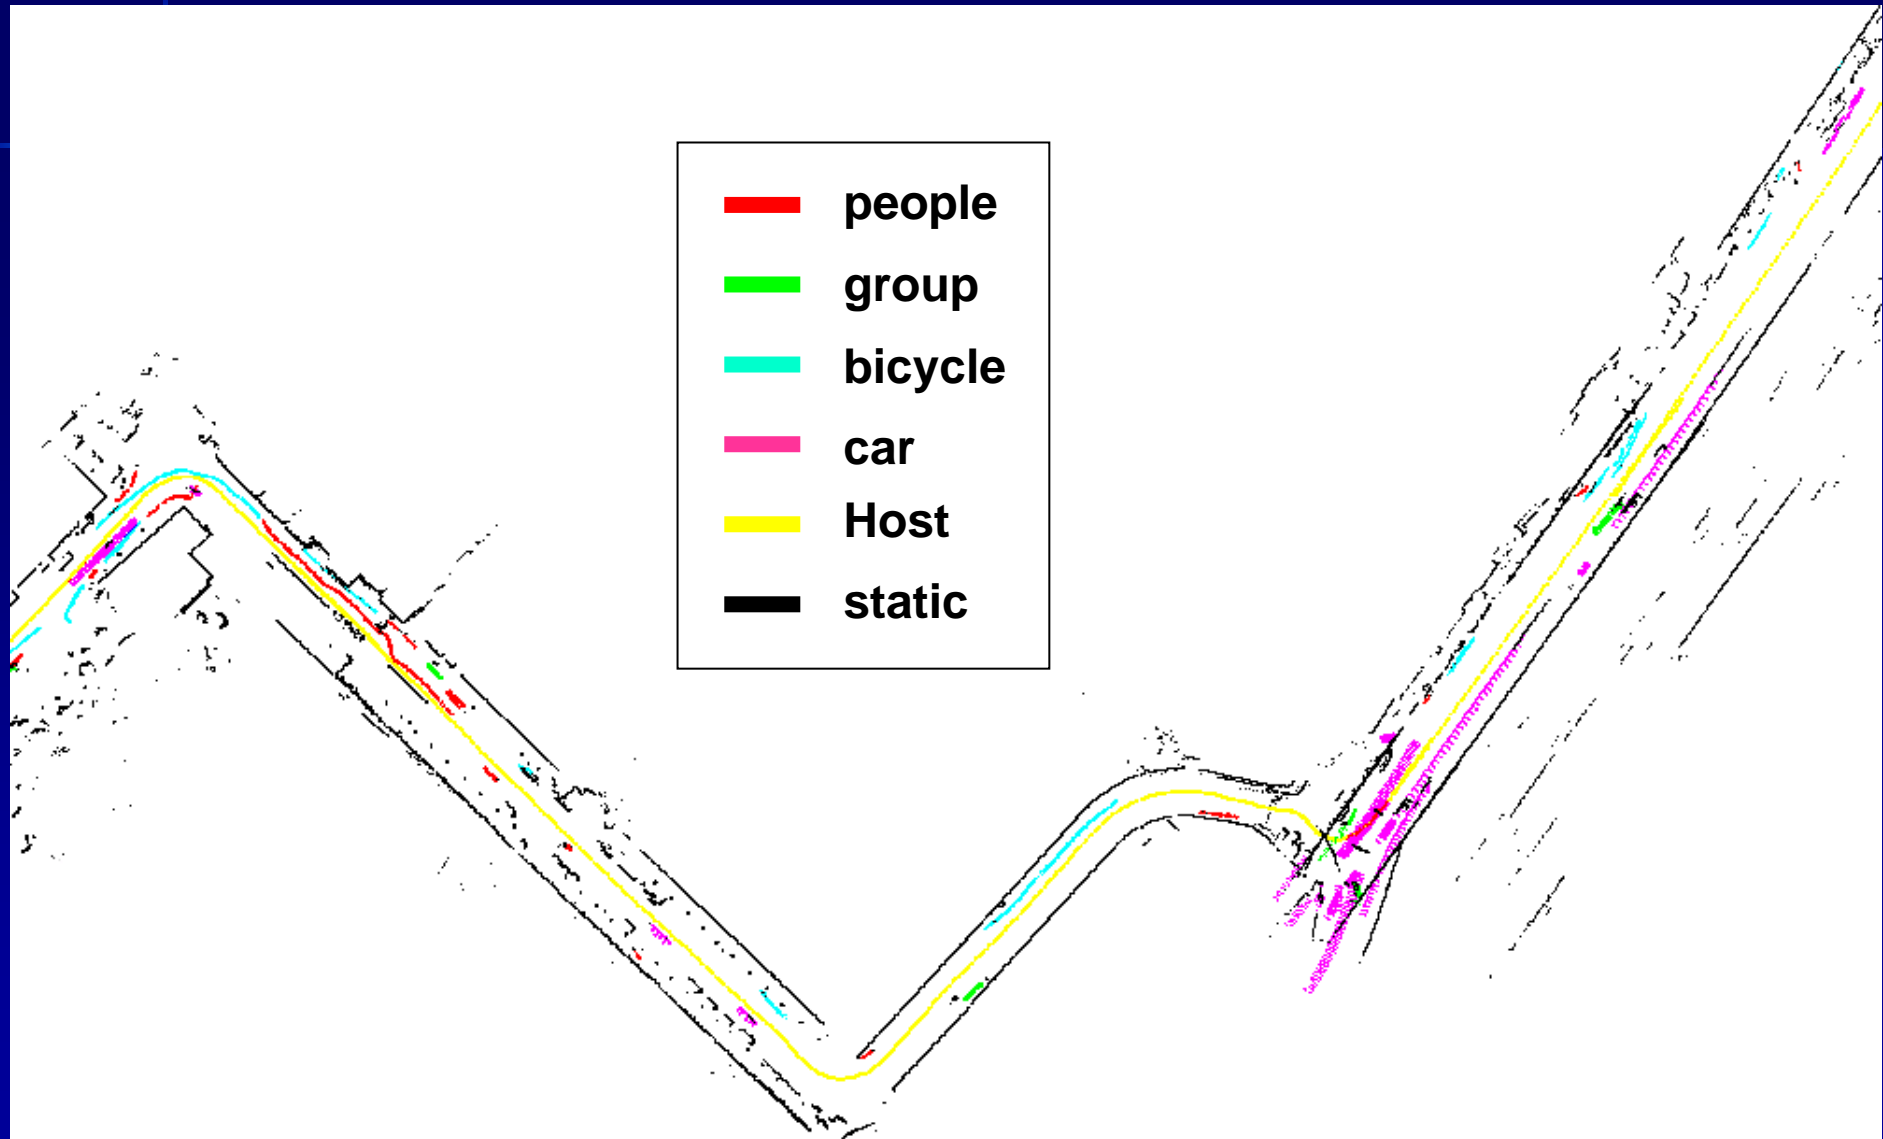

A map of static & mobile objects

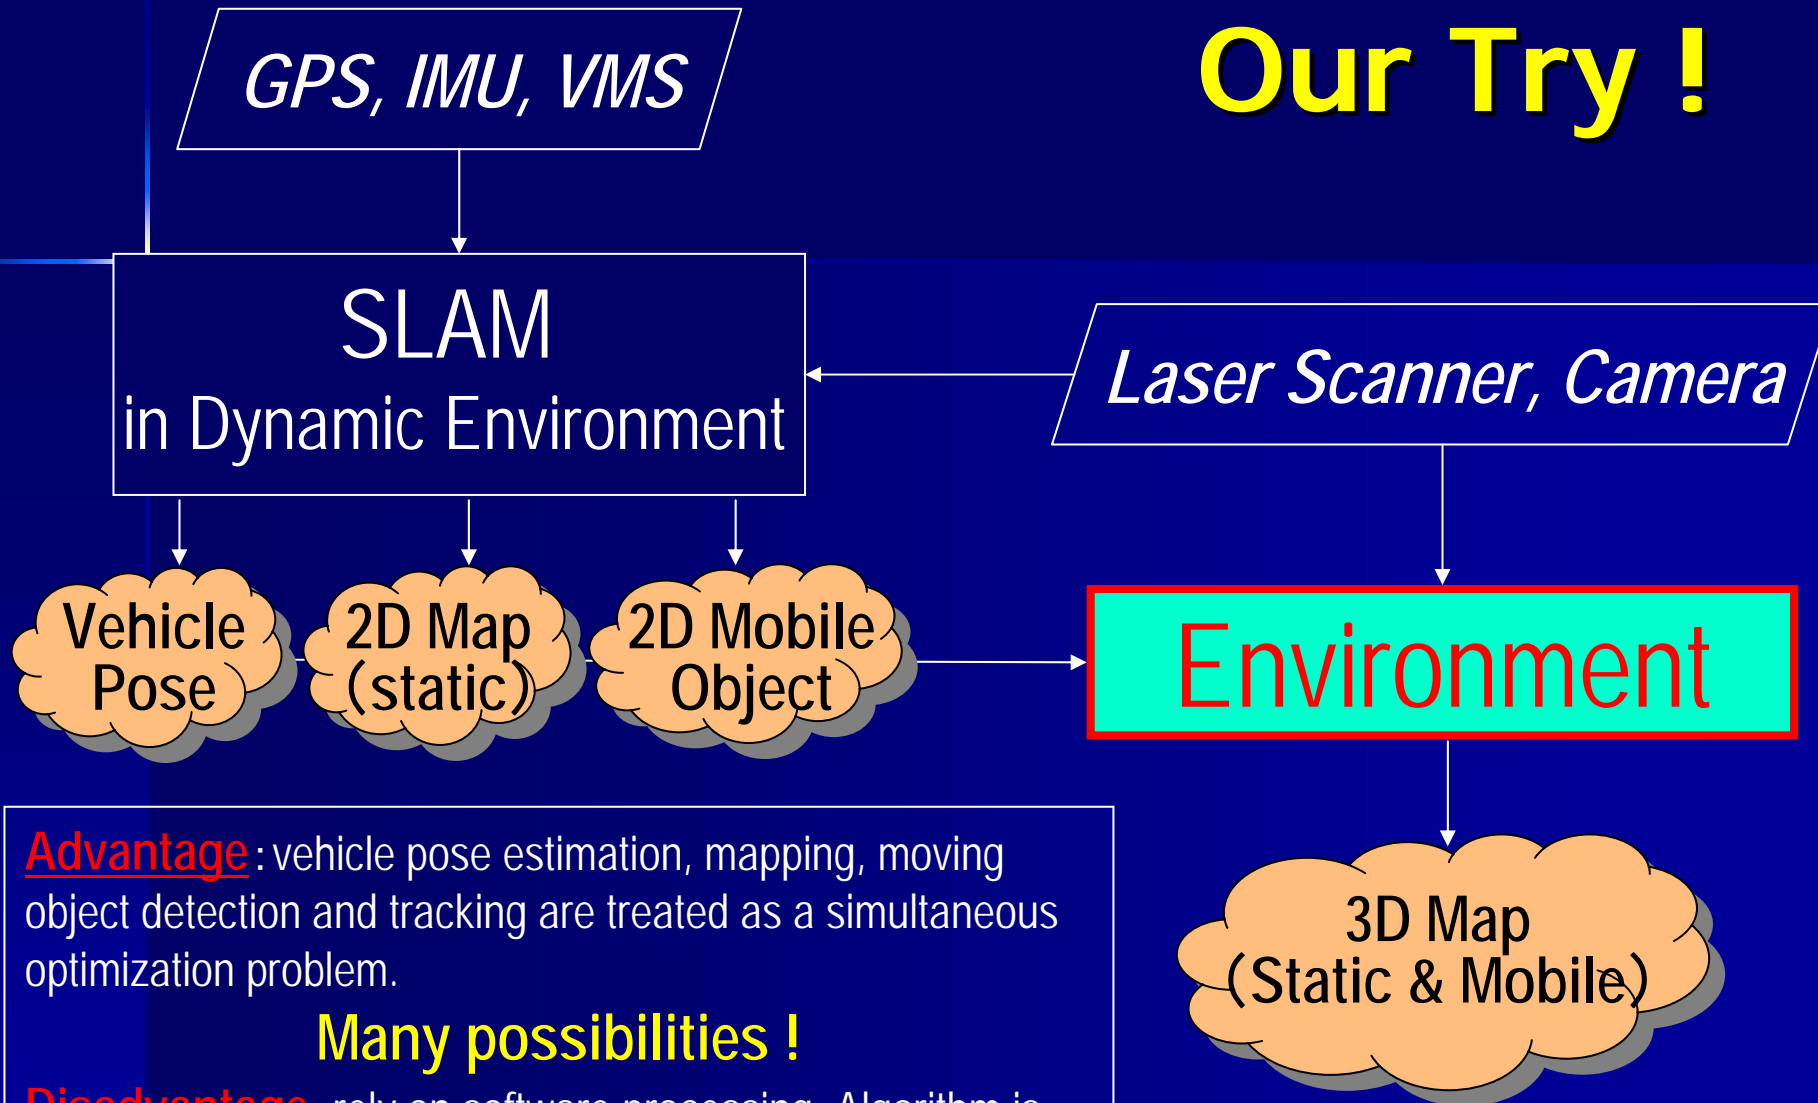

- people
- group
- bicycle
- car
- Host
- static

A map of static & mobile objects

Our Try !

Advantage: vehicle pose estimation, mapping, moving object detection and tracking are treated as a simultaneous optimization problem.

Many possibilities !

Disadvantage: rely on software processing. Algorithm is complicated. Computation cost is high.

We try to make a framework !
